

a) Farmer Dashboard

- Refer to C

b) Consumer Dashboard

- Can, Market prices not be renamed to Marketplace.
-

c) Institution Dashboard

- You can omit the market prices, delivery tracking from institution dashboard. I like research desk.
- Add the training programs
- Internship requests.

We need to have the link/connection between producers (Farmers) and Education (Institutions) in the following:

1. The producers should be able to display or request internships available to agricultural students.
2. The institution (Lectures) should be able to request for internship opportunities as well from farmers.
3. Farmers should then approve the internships requested or offerings.
4. The farmers should be presenting problems they experience to education/institution for research. the solution can be recommended by institution. (which i think cab be catered for by research already function existing on the app).
5. The Education sector should then be presenting the reports in the research desk (As existing on the app) – can be Named as research data as well.
6. When the education system has training programs – they can post it in community feed (/training program) for farmers to attend and training programs can be recorded/notes presented and posted on training programs (as existing on the app).

This means:

- x. The training programs, research desk, internships, should also be visible on the farmers (Producers side as well).
- m. The farmers can give problems they experience in research, institutions will see in in research and carry out research. Report will be displayed in research desk, and farmer can read on recommendations to solve the problem under research desk and they can act accordingly.

d) The notification button is good, which can give information updates, or requests within the app.

e) there are 3 big items which we are forgetting. Data, statistics and promotion dashboards.

Data – data should be drawn from what is happening on the app. Things like, sales happening, demands, items under sales and quantities, etc. That data can be drawn by the AI tools within the app. the data dashboard can help everyone on the app/out of the app make informed decisions.

Statistics – also statistics need to be generated from data collected. Like comparisons of trends of sales, trends of products sales, revenue/sales trends, quantity or demand trends etc. AI tool can assist as well.

Promotion – this one is for farmers that want to promote their products for obtaining preferential customers or when we need to assist them to get them customers for their products. Can be in adds form or just a screen of items moving sideways. Which should be visible to all sectors (producers, consumers and institutions).

F) Online payment through the app

These handle the split automatically — the buyer pays, the platform takes its cut, and the rest goes to the seller

Table 📄 ⬇️			
Provider	Best For	Commission Split	Key Feat
Stripe Connect	Global scale, flexibility	Automated; you define the %	Express/()
PayPal for Marketplaces	Brands trusting PayPal name	Automated split on capture	PayPal +
Adyen for Platforms	Enterprise / high volume	Automated split	Unified g
Square	US/UK/AU/CA/JP	Automated	Strong P
Razorpay Route	India + Southeast Asia	Automated split	Built for
Flutterwave	Africa + global expansion	Automated split	Sti ⬇️
